

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) Color organic display (OLED display) with pixels, which comprise a subpixel set with the colors[[,]] red, green, and blue, comprising:
 - a substrate, which is at least partially transparent to visible light,
 - a structured color filter, which generates the colors of the ~~subpixels~~ subpixel setand is subsequently arranged on the substrate,
 - a first electrode on the color filter, which is at least partially transparent to visible light,
 - at least one active layer on the first electrode, containing an emissive material, which is suitable for the generation of electromagnetic radiation, whose spectrum is matched to the color filter such that the pixels during control with the same electrical signal emit light whose color location lies within the white region of the CIE diagram, and
 - a second electrode arranged on the active layer.
2. (Original) The organic display according to claim 1, wherein the emissive material contains polymers with:
 - first chromophores, which produce a green color impression, and
 - second chromophores, which produce a red color impression.
3. (Original) The organic display according to claim 2, wherein the polymers contain chromophores, which produce a blue color impression.
4. (Original) The organic display according to any one of the preceding claims, wherein the first electrode is an anode and comprises indium tin oxide.

5. (Original) The organic display according to claim 1, wherein the active layer contains at least one polyspiro compound.

6. (Original) The organic display according to claim 1, wherein the active layer contains at least one polyluorene compound.

7. (Original) The organic display according to claim 1, wherein the individual subpixels of the subpixel set have the same lifetime.

8. (Currently Amended) A method, comprising of using ~~an~~ the organic display ~~with color filter technology~~ according to claim 1 in electronics.

9. (Currently Amended) A method, comprising of using ~~an~~ the organic display ~~with color filter technology~~ according to claim 1 for lighting purposes with adjustable color.

10. (Currently Amended) The organic display according to claim 1, wherein the at least one active layer comprises a blue-emitting polymer with red chromophores and ~~blue~~ green chromophores covalently coupled to the blue-emitting polymer.

11. (Original) The organic display according to claim 1, wherein the at least one active layer comprises a blue-emitting polymer blended with red chromophores and blue chromophores.

12. (Currently Amended) An organic device, comprising:
a substrate that is at least partially transparent to visible light,

a structured colored filter having a plurality of fields, wherein each field corresponds to a colored subpixel and transmits light with a color of the colored subpixel, and a red subpixel, a blue subpixel and a green subpixel form a pixel,

a first electrode on the colored filter,

an active layer on the first electrode, comprising an emissive material that is capable of emitting electromagnetic radiation comprising red light, green light and blue light, and

a second electrode on the active layer, wherein, upon driving the red subpixel, the blue subpixel and the green subpixel with a single selected current, the pixel is a white light pixel.

13. (Original) The organic device of claim 12, wherein:

the structured colored filter includes pigments and the emissive material for the blue subpixel is the emissive material for the red subpixel.

14. (Currently Amended) The organic device of claim 12, wherein the emissive material comprises a blue-emitting polymer with red chromophores and ~~blue~~ green chromophores covalently coupled to the blue-emitting polymer.

15. (Currently Amended) The organic device of claim 12, wherein the emissive material comprises a blue-emitting polymer blended with red chromophores and ~~blue~~ green chromophores.

16. (Original) The organic device of claim 12, wherein the emissive material comprises a polyspiro compound.

17. (Original) The organic device of claim 12, wherein the emissive material comprises a polyfluorene compound.

18. (New) An OLED display having a plurality of pixels, each pixel comprising a red subpixel, a green subpixel, and a blue subpixel, the OLED display comprising:

- a substrate, which is at least partially transparent to visible light,
- a structured color filter arranged on the substrate, the structured color filter having a plurality of fields, each field corresponding to a red subpixel, a green subpixel or a blue subpixel and configured to transmit light with a color of the corresponding subpixel,
- a first electrode on the color filter, which is at least partially transparent to visible light,
- at least one active layer on the first electrode, the active layer containing an organic emissive material for generating light having red, green and blue portions, and
- a second electrode arranged on the active layer, wherein when all subpixels of one pixel are driven with the same current density the emissive material causes the pixel to emit light with a color having CIE coordinates within a white region of a CIE diagram.

19. (New) The OLED display of claim 18, wherein the light emitting by the pixel is composed of the red, green and blue portions of the light generated by the emissive material of the active layer and transmitted by the structured color filter.

20. (New) The OLED display of claim 1, wherein the structured color filter includes a blue filter, a red filter and a green filter.
